

ELEVATOR PITCH

60 Seconds to Intelligent Design

The pitch. The practice tool. The cue cards.

~145 words • 6 beats • Confidential

Read it. Learn it. Own it.

HOOK Every autonomous system — from self-driving cars to military robots — must be architected, safety-analyzed, and verified before it ships. Today, engineers use tools built twenty years ago: fifteen-thousand-dollar-per-seat desktop software with zero AI, zero collaboration, and no integration across disciplines.

SOLUTION Luvian is the context layer for engineering intelligence. We connect requirements, designs, safety analysis, tests, and telemetry into one continuously evolving knowledge graph — with local-first reasoning that runs entirely on-device for air-gapped defense deployments.

WHY US We're three to ten times cheaper than incumbents like Cameo and DOORS. We're the only platform that gives AI a typed engineering graph to reason over — not a pile of disconnected strings. And our reasoning never leaves the customer's network.

MARKET The MBSE market is four-and-a-half billion dollars, growing fifteen percent annually to ten billion by 2031. We're targeting the fastest-growing slice: autonomous systems programs in defense, automotive, and aerospace.

TRACTION We've built the foundation — the structured-artifact layer of the graph, with AI copilots, real-time collaboration, and four industry demo verticals. We're now entering design partner conversations with robotics, mechatronics, and defense programs.

THE ASK We're raising two-and-a-half million dollars to land our first ten design partners and build the sales engine for the engineering intelligence layer.

"We're raising seven to ten million dollars to land our first ten design partners and build the sales engine for the engineering intelligence layer."

**1 HOOK · 0-10S**

Every autonomous system — from self-driving cars to military robots — must be architected, safety-analyzed, and verified before it ships. Today, engineers use tools built twenty years ago: fifteen-thousand-dollar-per-seat desktop software with zero AI, zero collaboration, and no integration across disciplines.

2 SOLUTION · 10-20S

Luvian is the context layer for engineering intelligence. We connect requirements, designs, safety analysis, tests, and telemetry into one continuously evolving knowledge graph — with local-first reasoning that runs entirely on-device for air-gapped defense deployments.

3 WHY US · 20-30S

We're three to ten times cheaper than incumbents like Cameo and DOORS. We're the only platform that gives AI a typed engineering graph to reason over — not a pile of disconnected strings. And our reasoning never leaves the customer's network.

4 MARKET · 30-40S

The MBSE market is four-and-a-half billion dollars, growing fifteen percent annually to ten billion by 2031. We're targeting the fastest-growing slice: autonomous systems programs in defense, automotive, and aerospace.

QUICK REFERENCE

Back-pocket numbers

Competitors to name-drop

Cameo / MagicDraw	\$5K–\$15K/seat/yr, desktop, SysML v1
IBM DOORS	\$5K–\$20K/seat/yr, complex, legacy
Jama Connect	\$5K–\$12K/seat/yr, req mgmt only
Capella	Free/open-source, no AI, no safety

Common follow-up Q&A

How is AI different from ChatGPT wrappers?

6-stage ambient pipeline, runs locally, trained on engineering domain. Not a chatbot — proactive suggestions.

Who's the team?

Solo technical founder + 20-year veteran SW engineer + PM. Hiring with seed funding.

When do you expect revenue?

Design partner revenue in Y1 (\$0.5–1.5M). \$2–5M Y2 target.

Intelligent Engineering Design

The platform where autonomous systems are architected, analyzed, and verified.
